

GuildForge

On-chain reputation and auto-payout tool for gaming and DAO guilds

The Problem & Our Solution

Guilds and DAOs still split rewards with spreadsheets and manual trust, not verifiable contribution data.

- Gaming guilds, DAOs, and hackathon teams lack fair, transparent ways to split rewards
- Manual trust and spreadsheets cause disputes and slow, error-prone payouts
- GuildForge logs contributions on-chain and auto-splits SOL/USDC proportionally
- Soulbound reputation NFTs make contribution history verifiable and permanent
- Smart contracts replace guesswork with transparent, rule-based distribution

How It Works

Create a guild, log contributions, earn soulbound reputation, and let a Solana program split incoming rewards automatically.

- User flow: create guild, invite members by wallet, log tasks/commits/wins
- Each logged contribution mints a soulbound NFT badge via Metaplex
- On-chain: Anchor program records contributions and computes reputation weights
- When funds arrive, the Solana program splits SOL/USDC proportionally to members
- Public guild profile page shows reputation history, powered by Supabase + Next.js

Built with

Solana, Anchor, Metaplex, Next.js,
Solana Program Library, Supabase,
Phantom Wallet Adapter

Why Now & What's Next

Distributed guilds and DAOs are scaling fast but still lack low-fee, trustworthy on-chain tools for fair rewards.

- Solana's low fees make per-contribution logging and micro-payouts practical
- Next: integrate Discord and game APIs for automatic contribution tracking
- Next: add dispute resolution through community voting
- Next: expand reputation portability across guilds and ecosystems
